Octave Quick Reference

Octave 8.0.0

Copyright 1996-2024 The Octave Project Developers

Starting and Stopping

octave --gui start Octave CLI/GUI session octave file run Octave commands in file octave --eval codeevaluate code using Octave octave --help describe command line options quit or exit exit Octave Ctrl-C terminate current command and return to top-level prompt

Getting Help

help command briefly describe command doc use Info to browse Octave manual doc command search for command in Octave manual lookfor str search for command based on str

Command Completion and History

TAB complete a command or variable name

Alt-? list possible completions Ctrl-r Ctrl-s search command history

Directory and Path Commands

cd dirchange working directory to dir pwd print working directory ls [options] print directory listing what list .m/.mat files in the current directory path search path for Octave functions pathdef default search path addpath (dir) add a directory to the path getenv (var) value of environment variable

Package Management

Add-on packages are independent of core Octave, listed at https://packages.octave.org/

pkg install -forge pkqdownload and install pkq pkg install file.tar.qz install pre-downloaded package file pkg list show installed packages pkg load / pkg unload load/unload installed package statistics optimization various common packages control signal image symbolic etc.

Matrices

Square brackets delimit literal matrices. Commas separate elements on the same row. Semicolons separate rows. Commas may be replaced by spaces, and semicolons may be replaced by newlines. Elements of a matrix may be arbitrary expressions, assuming all the dimensions agree.

 $[x, y, \dots]$ enter a row vector $[x;y;\dots]$ enter a column vector [w, x; y, z] enter a 2×2 matrix rows columns number of rows/columns of matrix zeros ones create matrix of zeros/ones eve diag create identity/diagonal matrix rand randi randn create matrix of random values sparse spalloc create a sparse matrix ลไไ true if all elements nonzero

any true if at least one element nonzero nnz number of nonzero elements

Multi-dimensional Arrays

number of dimensions ndims reshape squeeze change array shape resize change array shape, lossy cat join arrays along a given dimension permute ipermute like N-dimensional transpose shiftdim circshift cyclically shift array elements meshgrid matrices useful for vectorization

Ranges

Create sequences of real numbers as row vectors.

base: limit base: incr: limit incr == 1 if not specified. Negative ranges allowed.

Numeric Types and Values

Integers saturate in Octave. They do not roll over.

int8 int16 int32 int64 signed integers uint8 uint16 uint32 unsigned integers uint64 single double 32-bit/64-bit IEEE floating point intmin intmax flintmax integer limits of given type realmin realmax floating point limits of given type inf nan NA IEEE infinity, NaN, missing value eps machine precision 3.14159..., 2.71828...pi e i j $\sqrt{-1}$

Strings

A string constant consists of a sequence of characters enclosed in either double-quote or single-quote marks. Strings in doublequotes allow the use of the escape sequences below.

// a literal backslash \" a literal double-quote character ١, a literal single-quote character \n newline, ASCII code 10 \t horizontal tab. ASCII code 9 sprintf sscanf formatted IO to/from string strcmp compare strings join strings strcat strfind regexp find matching patterns strrep regexprep find and replace patterns

Index Expressions

var(idx)select elements of a vector var(idx1, idx2)select elements of a matrix var([1 3], :) rows 1 and 3 var(:, [2 end])the second and last columns var(1:2:end.get odd rows and even columns 2:2:end) elements of var1 corresponding to zero var1(var2 == 0)elements of var2 var(:) all elements as a column vector

Cells, Structures, and Classdefs

 $var\{idx\} = \dots$ set an element of a cell array cellfun (f, c)apply a function to elements of cell array $var.field = \dots$ set a field of a structure fieldnames (s) returns the fields of a structure structfun (f, s) apply a function to fields of structure classdef define new classes for OOP

Assignment Expressions

assign value to variable var = exprvar(idx) = expronly the indexed elements are changed var(idx) = []delete the indexed elements

Arithmetic Operators

If two operands are of different sizes, scalars and singleton dimensions are automatically expanded. Non-singleton dimensions need to match.

```
x + y, x - y
                     addition, subtraction
x * y
                     matrix multiplication
                     element-by-element multiplication
x \cdot * y
                     right division, conceptually equivalent to
x / y
                      (inverse (y') * x')'
x \cdot / y
                     element-by-element right division
x \setminus y
                     left division, conceptually equivalent to
                      inverse (x) * y
x \cdot \setminus y
                     element-by-element left division
x \hat{y}
                     power operator
x \cdot \hat{y}
                     element-by-element power operator
+= -= *= .*= /=
                     in-place equivalents of the above operators
./= \= .\= ^= .^=
-x
                     negation
+x
                     unary plus (a no-op)
                     complex conjugate transpose
                     transpose
x.
++x --x
                     increment / decrement, return new value
x++ x--
                     increment / decrement, return old value
```

Comparison and Boolean Operators

These operators work on an element-by-element basis. Both arguments are always evaluated.

```
< <= == >= >
                   relational operators
!= ~=
                   not equal to
                   logical AND
                   logical OR
                   logical NOT
```

Short-circuit Boolean Operators

Operators evaluate left-to-right. Operands are only evaluated if necessary, stopping once overall truth value can be determined. Non-scalar operands are converted to scalars with all.

```
x && y
                       logical AND
x \mid \mid y
                       logical OR
```

Operator Precedence

Table of Octave operators, in order of decreasing precedence.

() {} . array index, cell index, structure index
' ' ' ' ' ' ' transpose and exponentiation
+ - ++ --! unary minus, increment, logical "not"
* / \ .* ./ .\ multiplication and division
+ - addition and subtraction
colon
< <= == >= >! = relational operators
& | element-wise "and" and "or"
& | logical "and" and "or"
= += -= *= /= etc. assignment, groups left to right

statement separators

General programming

endfor, endwhile, endif etc. can all be replaced by end.

for x = 1:10 for loop endfor while ($x \le 10$) while loop endwhile do do-until loop until (x > 10) if ($x \le 5$) if-then-else

logif (x < 6)

elseif (x < 6) else

endif
switch (tf)
case "true"
case "false"
otherwise
endswitch

break exit innermost loop

continue go to start of innermost loop

return jump back from function to caller

switch-case

try cleanup only on exception

catch

unwind_protect cleanup always
unwind_protect_cleanup

Functions

 $\begin{array}{l} {\bf function} \ \left[{\it ret-list} \ = \right] \ function{-}name \ \left[\ (\it arg-list) \ \right] \\ {\it function-body} \\ {\bf endfunction} \end{array}$

ret-list may be a single identifier or a comma-separated list of identifiers enclosed by square brackets.

arg-list is a comma-separated list of identifiers and may be empty.

Function Handles and Evaluation

f (args) Evaluate a function handle f

feval Evaluate a function handle or string

eval (str) evaluate str as a command

system (cmd) execute arbitrary shell command string

Anonymous function handles make a copy of the variables in the current workspace at the time of creation.

Global and Persistent Variables

global $var = \dots$ declare & initialize global variable persistent $var = \dots$ persistent/static variable

Global variables may be accessed inside the body of a function without having to be passed in the function parameter list provided that they are declared global when used.

Common Functions

disp display value of variable printf formatted output to stdout

input scanf input from stdin who whos list current variables

clear pattern clear variables matching pattern
exist check existence of identifier
find return indices of nonzero element

find return indices of nonzero elements
sort return a sorted array

unique discard duplicate elements sortrows sort whole rows in numerical or

lexicographic order
sum prod sum or product
mod rem remainder functions
min max range mean basic statistics

median std

Error Handling, Debugging, Profiling

error (message) print message and return to top level
warning (message) print a warning message
debug guide to all debugging commands
profile start/stop/clear/resume profiling
profshow show the results of profiling

profexplore

File I/O, Loading, Saving

save load save/load variables to/from file save -binary save in binary format (faster) dlmread dlmwrite read/write delimited data csvread csvwrite read/write CSV files xlsread xlswrite read/write XLS spreadsheets

fopen fclose open/close files fprintf fscanf formatted file I/O textscan

fflush flush pending output

Math Functions

Run doc <function> to find related functions.

cov corrcoef covariance, correlation coefficient tan tanh atan2 trig and hyperbolic functions vector algebra functions

 det inv
 determinant matrix inverse

 eig
 eigenvalues and eigenvectors

 norm
 vector norm, matrix norm

rank matrix rank
qr QR factorization
chol Cholesky factorization
svd singular value decomposition

fsolve solve nonlinear algebraic equations

lsode ode45integrate nonlinear ODEsdass1integrate nonlinear DAEsintegralintegrate nonlinear functions

union set union intersection setdiff set difference

roots polynomial roots

polyder polyint polyromial derivative or integral polyfit polyval polynomial fitting and evaluation

 ${\tt residue} \qquad \qquad {\tt partial} \ {\tt fraction} \ {\tt expansion}$

legendre bessel special functions

conv conv2 convolution, polynomial multiplication deconv deconvolution, polynomial division

fft fft2 ifft(a) FFT / inverse FFT

freqz FIR filter frequency response filter filter by transfer function

Plotting and Graphics

plot plot3 2D / 3D plot with linear axes

line 2D or 3D line

patch fill 2D patch, optionally colored

semilogx semilogy logloglogarithmic axes
bar hist
bar chart, histogram

stairs stem stairsteps and stem graphs

 $\begin{array}{ll} \textbf{contour} & \textbf{contour} & \textbf{plot} \\ \textbf{mesh trimesh surf} & \textbf{plot } 3D \ \textbf{surfaces} \end{array}$

figure new figure

hold on add to existing figure

title set plot title

axis set axis range and aspect

xlabel ylabel zlabelset axis labelstextadd text to a plotgrid legenddraw grid or legend

image imagesc spy display matrix as image imwrite saveas print save figure or image imread load an image colormap get or set colormap
